a
Neither channel alone matches both together
Approved pairs recovered (%)
Both channels (DisAtlas)
Broad channel only
Specific channel only
Top 25%
Top 5%
Top 1%
Rank of the approved pair among random disease pairs
b
Each channel recovers pairs the other misses
Specific channel only (percentile)
n = 61
n = 212
n = 19
n = 29
Broad channel only (percentile)
Recovered with both channels
Not recovered with both channels
c
In every pair class, the specific channel recovers at least as many pairs as the broad channel
Shared cancer target (n = 127)
Shared tissue (n = 67)
Unassigned (n = 46)
Symptomatic (n = 28)
Convergent effector (n = 27)
Near-duplicate diseases (n = 18)
Same pathogen (n = 8)
Approved pairs recovered, top 25% (%)
d
Trained on evidence before the trial (166 pairs), a shared-neighbour count ranks them higher than DisAtlas
DisAtlas
Shared graph neighbours
Shared literature genes
Disease degree
Matched decoy diseases
Later indication in top 10% of candidates (%)
